

## ULTRA Filter Backflushing Manual

The Ultra filter has a back-flushing ability. This extends the life of your filter. The lifespan of the filter is 12 months and backflushing it approximately every month (or when the water flow noticeably decreases). For those of you that are looking for less maintenance... you can potentially get away with just backflushing after 12 months to get that bonus 6 months. Just keep an eye on the flow. The more the filter has the work the shorter the lifespan.

### **How to Backflush:**

Backflushing is simple, you just need to make sure there is a tube attached to the backflushing valve at the base of the Ultra filter. This tube needs to feed into a bucket to catch the water. Then open up the backflushing valve and let the water flow into the bucket for about 5 minutes(8-10Ltrs). You then close the valve again, discard the water and away you go.

**Working Pressure:** 15 - 55 PSI

**Please note:** If your water pressure is higher than 50 PSI then you need a pressure reducing valve in place upstream of the filters.

**Waterflow speed:** Tune T-line valve so water flow is approx 2 l/min

**Working Temperature:** 5 - 40°C

**Please note: Professional installation is recommended. Ionza is not responsible for any damage resulting from incorrect installation.**
